

ABSTRACT OF THE DISCLOSURE

5 The imaging apparatus for a microscope, according  
to the present invention, comprises an imaging section  
which picks up an observation image of a sample formed  
in a microscope body, an imaging apparatus body having  
the imaging section, a display section which displays  
image data corresponding to the observation image  
picked up by the imaging section, and an operation  
section which performs operation of the imaging  
10 section, wherein the imaging apparatus body and the  
display section are separate from each other.
